Frontend Engineer

SUMMARY

Frontend engineer who owned the entire frontend ecosystem of a shariah-based fintech platform from MVP to production rewrite, as the sole frontend engineer. I built 100+ pages across the platform's frontends, first the original application in React, then a full rewrite to a modern Next.js codebase, with a focus on performance, reusable components, and multi-brand, multi-language, multi-currency interfaces. I care about the details that make an interface feel effortless: responsiveness, loading and error states, accessibility, and clean design-to-code fidelity. Comfortable collaborating closely across the stack through API design reviews and backend debugging, with enough backend depth to move confidently when a feature calls for it. Known for system-level thinking, fast issue isolation, and delivering reliable, user-focused frontends.

SKILLS

Core	JavaScript, TypeScript, HTML, CSS
Frameworks	React, Next.js (App Router), TanStack Query, Vite, Astro
Styling	Tailwind CSS, shadcn/ui, MUI
Validation & Forms	Zod, React Hook Form
Testing	Jest, React Testing Library, Cypress, Playwright, Bun test, MSW
Frontend Architecture	Modular structure, reusable components, server/client separation, clean API layers, API integration
Tooling & DevOps	Git, Docker, GitHub Actions (CI/CD), AWS, Cloudflare, Vercel
Practices	Clean code, linting & formatting (ESLint, Prettier), strict TypeScript, immutable patterns, clean separation of concerns
Backend (Growing)	Go (REST APIs, error handling, concurrency), Node.js (personal production service), PostgreSQL, REST API design, Laravel PHP ecosystem basics, MySQL, Linux CLI

WORK EXPERIENCE

01/2026 – Present • **Large organization website (client confidential)**
Freelance Frontend Engineer

- Built a multi-division organization website in Next.js and TypeScript, covering division profiles, vision and mission, leadership and team pages, and program information. Designed a reusable page and component structure so the many similar division pages share one consistent, maintainable architecture.
- Containerized the application with Docker, initialized the project on the client's private server, and ran the deployment there.

02/2023 – 01/2026 • **PT. Nabitu Teknologi Islami / Zeed Mitra Pte. Ltd.**
Frontend Engineer
Shariah-based investment platform connecting SMEs with 3,000+ investors.
Portfolio: nabitu.id & zeedsharia.com

- Built and launched the first major frontend version of the platform in React, taking it from MVP to a production-ready investment application. The customer support team relayed strong user feedback after launch, noting a significantly improved experience and usability.
- Sole Frontend Engineer owned all frontend delivery: development, architecture, UI/UX refinement, QA validation, debugging, and deployment.
- Led a 1.5–2 year platform frontend rewrite to Next.js, delivering a new landing page (12 pages), member dashboard (37 pages), and admin panel (21 pages) supporting both local and global brands.

- Designed a modern frontend architecture (server components, modular API layers, reusable components, strict TypeScript), improving maintainability and enabling clearer frontend–backend integration.
- Achieved ~2× faster performance with smoother transitions through optimization and improved data-fetching patterns, informed by close inspection of API behavior and data flow.
- Delivered multi-brand and multi-language interfaces, including global currency logic and international UX variations.
- Worked closely with backend (Go and Laravel) and product to define API contracts, investigate cross-layer issues, inspect backend logic, and ensure accurate, production-ready feature delivery.

05/2022 – 01/2023 • **Indosat Ooredoo Hutchison Digital Camp (Bootcamp)**
IDCamp scholarship in the Front-End Web Developer Learning path
Selected as one of 75 scholarship recipients out of over 60,000 applicants across all learning paths, a highly competitive program run by Indosat Ooredoo Hutchison to develop Indonesian developers ready for the digital economy. Completed the Expert-level Front-End Web Developer path with a perfect 5/5 stars on the Final Project. The program covered the full spectrum of modern frontend fundamentals: semantic HTML, CSS, and responsive web design; JavaScript including ES6+ syntax and asynchronous request handling; tooling with NPM, Webpack, and clean code practices via ESLint and Prettier; advanced topics including Web Components, Web Storage, Web Accessibility, performance optimization, and Progressive Web Apps; and engineering practices including Automation Testing, Test-Driven Development with Jasmine, and CI/CD pipelines.

PART-TIME EXPERIENCE

11/2024 – 03/2025 • **RS HJ Bunda Halimah Batam**
Frontend Engineer (Freelance, part-time)
Delivered two integrated frontends for RS. Hj. Bunda Halimah (Batam): a Patient Portal for online doctor search, appointment booking, and patient self-service, and an Admin CMS for staff to manage doctors and editorial content. Both apps use a Next.js 15 / TypeScript foundation.

- Built both apps on Next.js 15 (App Router) with React Server Components, Server Actions, and strict TypeScript, backed by a typed, centralized API layer and a unified error handler that normalizes API, validation, and timeout failures into a consistent response shape.
- Designed and shipped the doctor appointment booking flow on the Patient Portal, covering schedule grouping, reschedule and cancellation handling, next-available-date logic, and login-gated booking, wired end-to-end to typed server actions.
- Implemented secure server-side authentication (Server Actions, HttpOnly cookies, middleware.ts route protection) across both apps, and shipped the Admin CMS with doctor profile/schedule management and full article CRUD, featuring a sanitized React-Quill rich-text editor, draft/published/scheduled workflow, and SEO metadata, with all forms typed end-to-end via React Hook Form + Zod.

PERSONAL PROJECTS

Norven
norven.farulivan.com – github.com/farulivan/norven
A fictional architecture studio built as a portfolio piece to demonstrate engineering craft. Built with Astro 6, TypeScript (strictest), Tailwind v4, GSAP + ScrollTrigger, and deployed on S3 + Cloudflare with GitHub Actions OIDC, no long-lived credentials anywhere. Includes Playwright E2E tests with WCAG AA gates and Lighthouse CI performance budgets enforced on every PR. Architecture decisions documented as ADRs in the repo.

Roomflow
roomflow.farulivan.com – github.com/farulivan/roomflow
A multi-hotel guest-service dashboard for hotel staff, built as a portfolio project with a simulated backend. Staff manage room service, housekeeping, laundry, extra-bed and spa requests, with server-side search, filters and pagination held in the URL, per-service SLA alerts, a manager approval flow, and live new-order toasts that never steal focus. Built with React 19, strict TypeScript, Vite, Tailwind v4, shadcn/ui, TanStack Query and React Hook Form + Zod, tested with Bun's test runner and Testing Library, and deployed on Cloudflare Workers. Optimistic status

updates roll back on failure, queries are scoped per hotel, and a “Demo controls” panel simulates slow networks and API errors. Dependencies flow one way (UI, queries, API client, domain), and the design decisions are documented in the repo.

Personal WA Bot
github.com/farulivan/personal-wa-bot
WhatsApp bot my family uses daily to track workouts, Quran reading, and prayer times. It runs on a production TypeScript/PostgreSQL backend with hexagonal architecture. Cut memory by 85% (0.8 GB → <100 MB) by replacing headless Chromium with a WebSocket client, which also removed the root cause of both production outages. Built a restart-safe scheduler (FOR UPDATE SKIP LOCKED, exactly-once claiming), used branded types to turn a recurring identity bug into a compile error, and wrote 600+ deterministic tests with injected time. Docker, CI, ADRs, postmortems.

EARLIER EXPERIENCE

01/2021 – 05/2022 • **Young Master Studio, Freelance**
3D Architecture Visualizer
Worked independently with clients to produce 3D architectural visualizations, managing the full process from brief interpretation to final delivery. Developed a sharp eye for spatial detail, material accuracy, and visual communication, skills that directly inform how I approach UI precision and design fidelity today.

02/2018 – 01/2021 • **Indonesia Fire Protection**
Fire Protection Specialist
Contributed to the design and implementation of fire protection systems for large-scale industrial and commercial projects across Indonesia, working as part of an engineering team. Projects included PT. HM Sampoerna (Cikarang and Sukorejo), BNI Centre Office (Sudirman, Jakarta), and PT. PLN Nii Tanasa Power Plant (Sulawesi). Obtained certification as a Fire Alarm and Protection System Engineer covering system design, engineering calculation, installation, and programming. Work required close coordination across disciplines, attention to technical detail, and clear documentation throughout each project phase.

02/2016 – 02/2018 • **Indonesia Fire Protection**
Junior Fire Protection
Supported fire protection system design and implementation for PT. PLN electrical power plants across Sumatra. Gained foundational experience in reading technical drawings, working within engineering constraints, and contributing to large infrastructure projects under senior engineer supervision.

EDUCATION

2011 - 2016 • **University of Indonesia**
Bachelor of Architecture

CERTIFICATIONS

2026 • **Boot.dev**
Back-End Developer Path (TypeScript & Go)

2022 • **Dicoding Indonesia**
Dicoding Frontend Web Developer Expert

2022 • **Codecademy**
Front-End Engineer Career Path
